FORENSIC EXAMINATION REPORT

Case Reference: CW-001
Examining Officer: (fictional) Dr. S. Priyanka, Forensic Analyst
Date of Examination: 2026-10-20
Exhibit Reference: SL-INV-224 (missing carton), Door Lock Assembly (side entrance)

1. SCOPE OF EXAMINATION

This report covers physical examination of the side entrance door lock assembly and the storage rack area adjacent to where carton SL-INV-224 was last recorded present, at Srinivasan Logistics Warehouse.

2. FINDINGS

2.1 Door Lock Assembly
No signs of forced entry were observed on the external door lock mechanism. The lock shows normal wear consistent with routine use. No tool marks, scratches, or pry damage were present around the strike plate or bolt.

2.2 Storage Rack Area
A faint shoe impression was recovered from the dust layer on the floor tile immediately in front of the rack where carton SL-INV-224 was stored. The impression is partial and insufficient for a conclusive comparison match against any reference footwear at this time.

2.3 Fingerprint Examination
Latent fingerprint examination was conducted on the rack edge and the interior door handle. One partial latent print was recovered from the door handle interior surface. The print quality is insufficient for AFIS comparison due to smudging, likely from repeated routine handling.

3. LIMITATIONS

The absence of forced-entry marks does not establish that entry was authorized; it is equally consistent with a key-holder or an unlocked door at the time of entry. The partial shoe impression and latent print cannot presently be matched to any individual. No DNA swabbing was conducted as part of this examination; this remains a recommended follow-up step.

4. CONCLUSION

Physical examination neither confirms nor rules out unauthorized entry. Further investigative steps (CCTV review, witness interviews, and if authorized, DNA swabbing of the door handle) are recommended to resolve the open questions raised in the incident report.
